1. Introduction

1.1 Overview

CANopen is one kind of the network protocols based on CAN bus and mainly used for embedded system, such as industrial machine control, vehicle control system, factory automation, medical equipments control, remote data acquisition, environment monitoring and package machines control. The CAN-2026C is a CANopen slave which follows the CiA 301 version 4.02 and CiA 401 version 2.1. This module provides 6 analog input channels, 2 analog output channels, 2 digital input channels and 1 digital output channel. Users can obtain those data or configure the CAN-2026C via the standard CANopen protocol. In order to be fully compatible with other CANopen devices, the CAN-2026C has passed the validation of the CiA CANopen Conformance Test tool. Therefore, it is very easy to integrate the CAN-2026C with the standard CANopen master by applying the EDS file. Combining with the CANopen masters of ICP DAS, you can quickly build a CANopen network to approach your requirements.

2.1 Structure

2.2 Node ID & Baud Rate Rotary Switch

The rotary switches for node ID configure the node ID of the CAN-2026C module. These two switches are for the tens digit and the units digit of node ID. The node ID value of this demo picture is 32.

Node ID rotary switch

The rotary switch for baud rate handles the CAN baud rate of the CAN-2026C module. The relationship between the rotary switch value and the practical baud rate is presented in the following table.

Baud rate rotary switch

Rotary Switch Value	Baud rate (k BPS)
0	10
1	20
2	50
3	125
4	250
5	500
6	800
7	1000

2.3 LED Description

Power LED

The CAN-2026C needs a 10V~30VDC power supply. Under a normal connection, a good power supply and a correct voltage selection, as the unit it turned on, the LED will light up in red.

Run LED

The Run LED indicates the CANopen operation state. The description of the LED state is shown below. About the details, please refer to the section 2.3.1 of the CAN-2000C user manual.

LED Signal	State	Description
No Light	Non-power	Power Supply is not ready
Single Flash	Stopped	The device is in Stopped state
Blinking	Pre-operation	The device is in the pre-operation state
Continuing Light	Operation	The device is in the operational state

Error LED

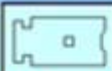

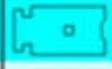

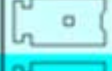

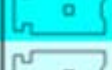

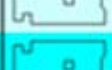

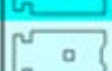

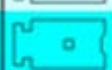

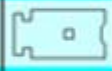

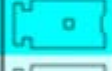

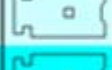

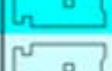

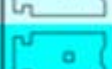

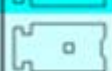

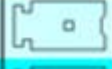

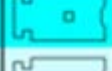

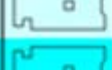

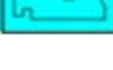

The Error LED indicates the CANopen error state. The description of the LED state is shown below. About the details, please refer to the section 2.3.2 of the CAN-2000C user manual.

LED Signal	State	Description
No Light	Non error	Device is in working condition
Single Flash	Error Warning	At least one error of the CAN controller has occurred
Blinking	Guarding fail	Guard event happened
Continuing Light	Bus Off	The CAN controller is bus off

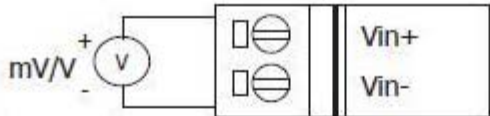

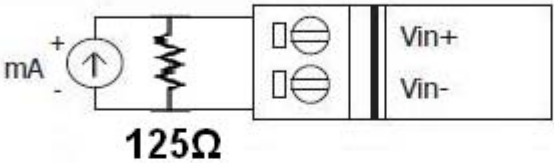

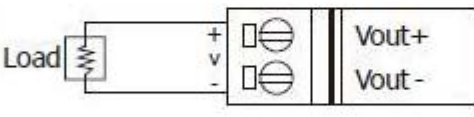

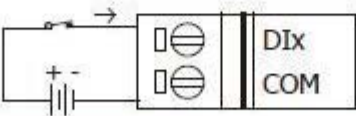

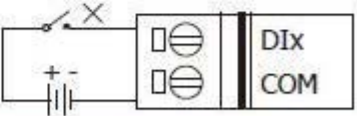

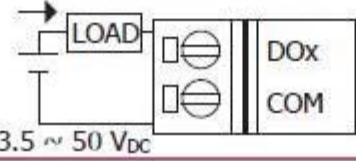

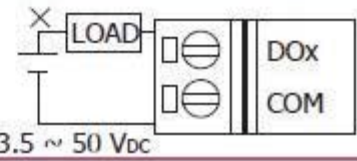

Terminal Resistor LED

When the switch of the 120Ω terminal resistor is turned on, the terminal resistor LED will be lightening.

3.3 Application Object

Type code of CAN-2026C module (0x2004)

The user can read the object with index 6401h and subindex 1~6 to get the AI value of the channel 0~6, and the range for each AI type code are listed in Appendix. If the user wants to change the AI input type, write the type code to the object with index 2004h and subindex 1~6. For example, if the node ID of CAN-2026C is 1, the following command would be used:

11-bit COB-ID (bit)											RTR	Data Length	8-byte Data (byte)							
Func Code				Node ID																
10	9	8	7	6	5	4	3	2	1	0			0	1	2	3	4	5	6	7
1	1	0	0	0	0	0	0	0	0	1	0	8	2F	04	20	01	09	00	00	00

581	0	8	60	04	20	01	00	00	00	00

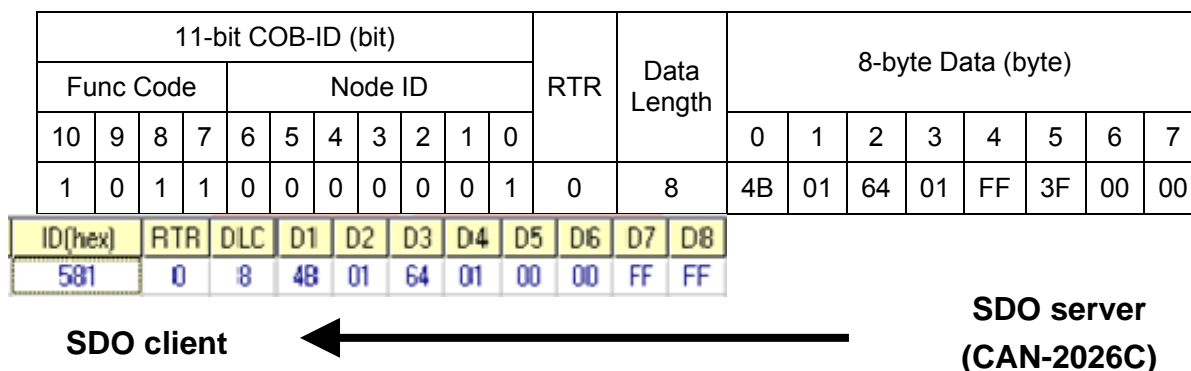

Analogue Input module (0x6401)

Writing object with index 2004h and subindex 1 with 9h means to change the type code of the AI channel 0 with 9h.

11-bit COB-ID (bit)											RTR	Data Length	8-byte Data (byte)							
Func Code				Node ID																
10	9	8	7	6	5	4	3	2	1	0			0	1	2	3	4	5	6	7
1	1	0	0	0	0	0	0	0	0	1	0	8	40	01	64	01	00	00	00

601	0	8	40	01	64	01	00	00	00	00

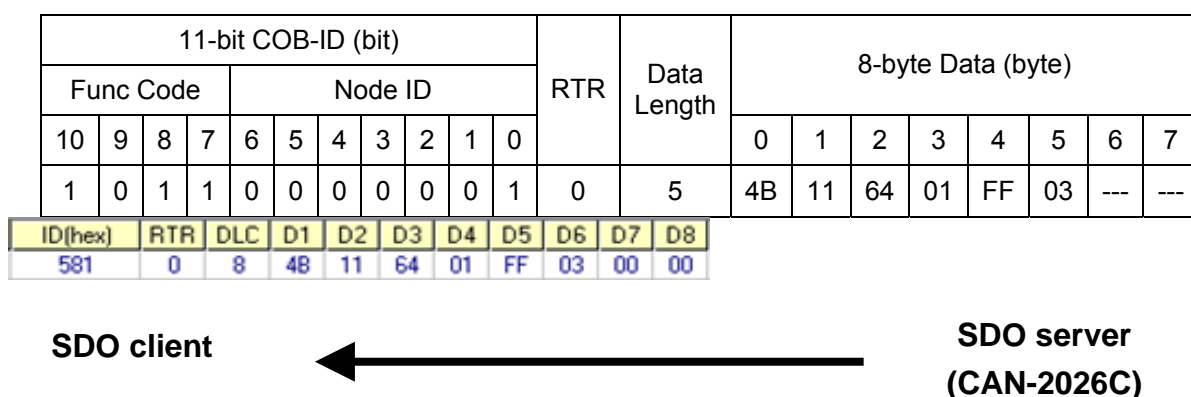

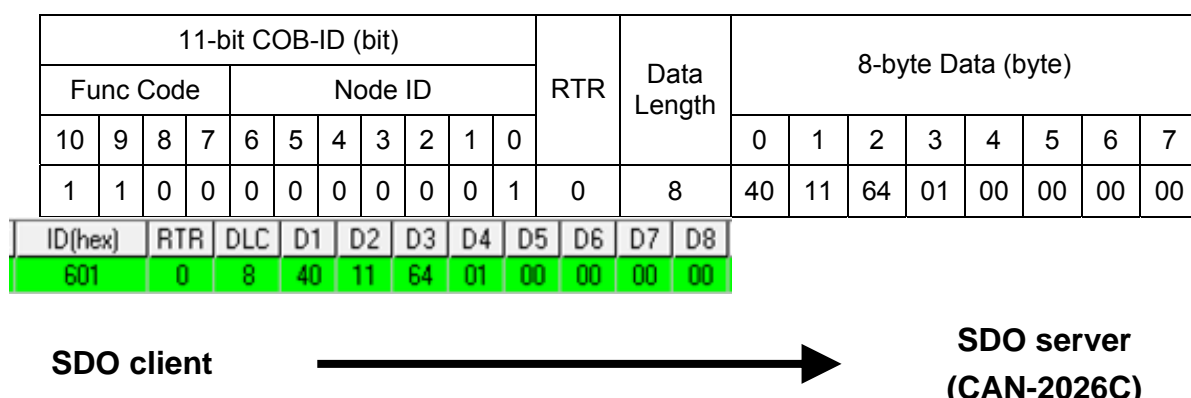

Reading object with index 6401h and subindex 1 means to get the value of the AI channel 0. According to the type code 9h set before, the replied value of the AI channel 0 is 3FFFh.

Analogue Output module (0x6411)

User can use the object index 0x6411 with subindex 1 to read a group of 16-bit information. For example, if the node ID of the CAN-2026C is 1, the commands are listed as below:

Read the object index 0x6411 with subindex 1, and the value 0x3FFF of the AO channel 0 will be responded by CAN-2026C module. User can use the object index 0x6411 with subindex 1 to write output value (Hex format) into CAN-2026C module. The commands are as follows.

11-bit COB-ID (bit)											RTR	Data Length	8-byte Data (byte)							
Func Code				Node ID																
10	9	8	7	6	5	4	3	2	1	0			0	1	2	3	4	5	6	7

SDO client

SDO server
(CAN-2026C)

Write the 0x0800 value into the object index 0x6411 with subindex 1 of CAN-2026C, and the AO channel 0 will output the 5V if you select the 0~10 V output range.

Analogue Output Error Mode (0x6443)

This object defines whether an output is set to a pre-defined error value (see 6444h object) in case of an internal device failure or a ‘Stop remote node’ indication.

0 = actual value rest.

1 = reverts to error value integer (6444h).

others= reserved.

For example, if the node ID of the CAN-2026C is 1, the commands are as follows:

11-bit COB-ID (bit)											RTR	Data Length	8-byte Data (byte)

Write object index 0x6443 with subindex 1 to subindex 2, which can set each channel for actual value rest mode or reverts to error value integer mode.

Analogue Output Error Value Interger (0x6444)

On condition that the corresponding Error Mode is active, device failures will set the outputs to the value configured by this object (index = 0x6444).

For example, if the node ID of CAN-2026C is 1, the commands are shown below:

11-bit COB-ID (bit)											RTR	Data Length	8-byte Data (byte)									
Func Code				Node ID																		
10	9	8	7	6	5	4	3	2	1	0			0	1	2	3	4	5	6	7

581	0	8	60	44	64	01	00	00	00	00

Write the output value 0x03FF into the object index 0x6444 with subindex 1. The CAN-2026C responds that it is successful.

Error Mode and Error Value (0x6443, 0x6444)

The object 0x6443 and 0x6444 are used to control the safe value when the CAN-2026C is into stop mode or some error happens, such as node guarding failure, it will check the value of the object 0x6443. If some bits of the subindex 1 of this object are set to 1, the corresponding AO channels will output the error mode output values which are described in the corresponding subindex of the object 0x6444.

For example, if set the value 1 into the object of 0x6443 with subindex 1 and a value 0x3FFF into the object 0x6444 with subindex 1 respectively, when some error event occurs, only the channel 0 will output the error mode output value 0x3FFF because the index 0x6443 with subindex 1 is set to 1. The others channels keeps the status as the error event is not happened.

Write object index 0x6444 and subindex 1 to 0x03FF means that setting the error value to 0x03FF for activating the error mode output value of channel 0. If the error event occurs, the module will output the safe value 0x03FF corresponding the object 0x6443 and 0x6444.

Set Module to Operation Mode when powering on (0x2100)

This object 0x2100 with subindex 1 defines if the module will enter operation mode automatically when powering on.

For example, if the node id of CAN-2026C is 1, the commands are as below:

11-bit COB-ID (bit)											RTR	Data Length	8-byte Data (byte)							
Func Code				Node ID																
10	9	8	7	6	5	4	3	2	1	0			0	1	2	3	4	5	6	7
