## Introduction

CAN FD (CAN with Flexible Data-Rate) is a newer extension version of the CAN 2.0 protocol. It was developed by Bosch and was released in 2012. It has been significantly improved during the standardization process and is nowadays in ISO 11898-1:2015. The CAN FD speeds up the data transmission and packs more data into each message.
PISO-CAN400U-FD series board is a very powerful and economic solution for an active CAN board, containing four CAN channels that cover a wide range of CAN applications. It uses Microchip CAN FD controllers and TI TCAN1042HG series transceivers, which provide bus arbitration and error detection features, combined with auto-correction and re-transmission functionality. As the PISO-CANFD series board is state-of-the-art, it can be installed in either a Universal PCI bus.
